Gold and Nickel Drill Program - Mt Remarkable

Highlights

- **Drilling targeting gold and nickel anomalies commencing in mid April**
- **Additional lease applications expand project to ~450 km²**

Air core and reverse air blast (RAB) drilling targeting several gold and nickel soil anomalies will commence at the Mt Remarkable gold and nickel project in mid April. The drilling program consists of 1000 metres of air core drilling targeting gold anomalies identified around old workings (figure 1) and 2000 metres of RAB drilling targeting a major nickel copper soil anomaly on the western side of the project (figure 2). The Company considers the tenement package to have the potential to host a significant nickel and/or gold deposit.

Gold Drilling Targets

Compilation of historical reverse air blast and reverse circulation drilling data has identified significant gold intersections of 2 metres at 29.9 g/t gold, 2 metres at 2.3 g/t and 2 metres at 1.5 g/t gold under the Mt Remarkable Mining centre. The bulk of drilling has been shallow indicating that the region has not been adequately tested at depth (Table 1).

Hole	Drill Type	From Depth	Width	Gold (ppm)
PENZOIL RAB hole 1	RAB	7m	1m	19
PENZOIL RAB hole 2	RAB	surface	2m	29.9
including	RAB	surface	1m	56
MRP6	RC	3m	1m	4.1
MRP5	RC	11m	1m	2.7
MRP 10	RC	25m	2m	2.3
RNRB1	RAB	18m	1m	1.7
RNRB 4	RAB	14m	2m	1.5
RRB11	RAB	31m	1m	1.2

Table 2: Historical drilling results at the Mt Remarkable mining centre

Soil geochemical sampling of the area surrounding the historical drilling has identified an area of highly anomalous results north and north east of the Mt Remarkable Mining Centre. Soil results of up to 165 times background have been recorded and the Company will commence air core drilling of these targets in mid April focussing on testing below the old workings at depth and along the highly anomalous northern extent of the historical mining. Results are expected to be available in mid May.

Nickel Drilling Targets

Soil sampling also identified large areas of nickel-copper anomalism associated with a mafic/ultramafic unit on the western side of the lease in an area not historically explored. The anomalous nickel results have higher nickel values than the MMI results for the Company's flagship project the White Cliff

Gossan (max 3250 ppb nickel) providing significant encouragement that the Mt Remarkable ultramafic is prospective for nickel sulphide mineralisation. RAB drilling will commence to cover all three nickel targets (CR1-3) in mid April.

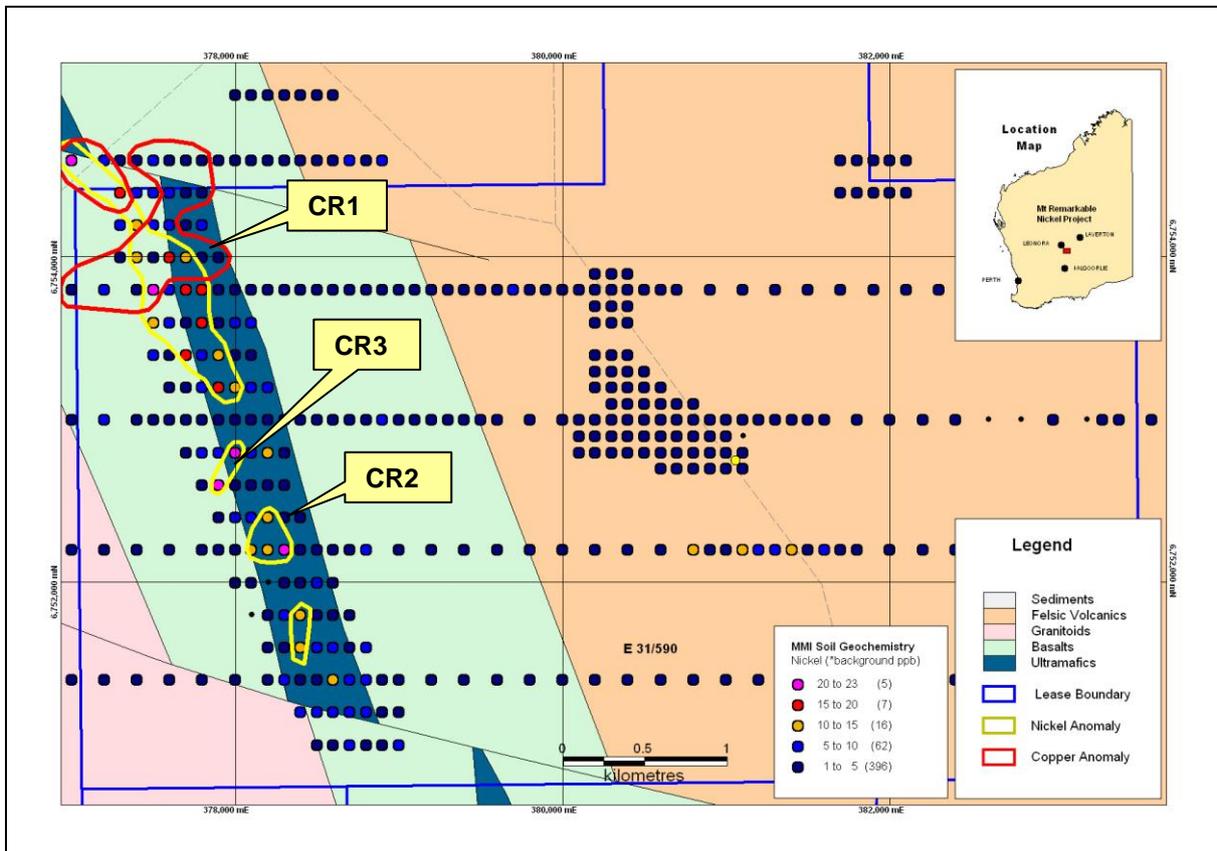

Figure 2: Tenement location map with soil sample results indicating nickel and copper anomalism.

Additional Lease Applications Expand Project to ~450 km²

The Mt Remarkable Project is located within the North Eastern Goldfields of Western Australia, approximately 170 km N-NE of Kalgoorlie and about 25 km SE of Kookynie. The project has undergone significant expansion with recent lease applications increasing the project to over 450 km² of basalt, ultramafic and felsic rocks prospective for gold and nickel (figure 3). While the majority of the project is still at the application stage the Company has commenced an extensive geochemical sampling program to identify potential gold and nickel drilling targets (figure 3). The results of this program will be reported during the June quarter.

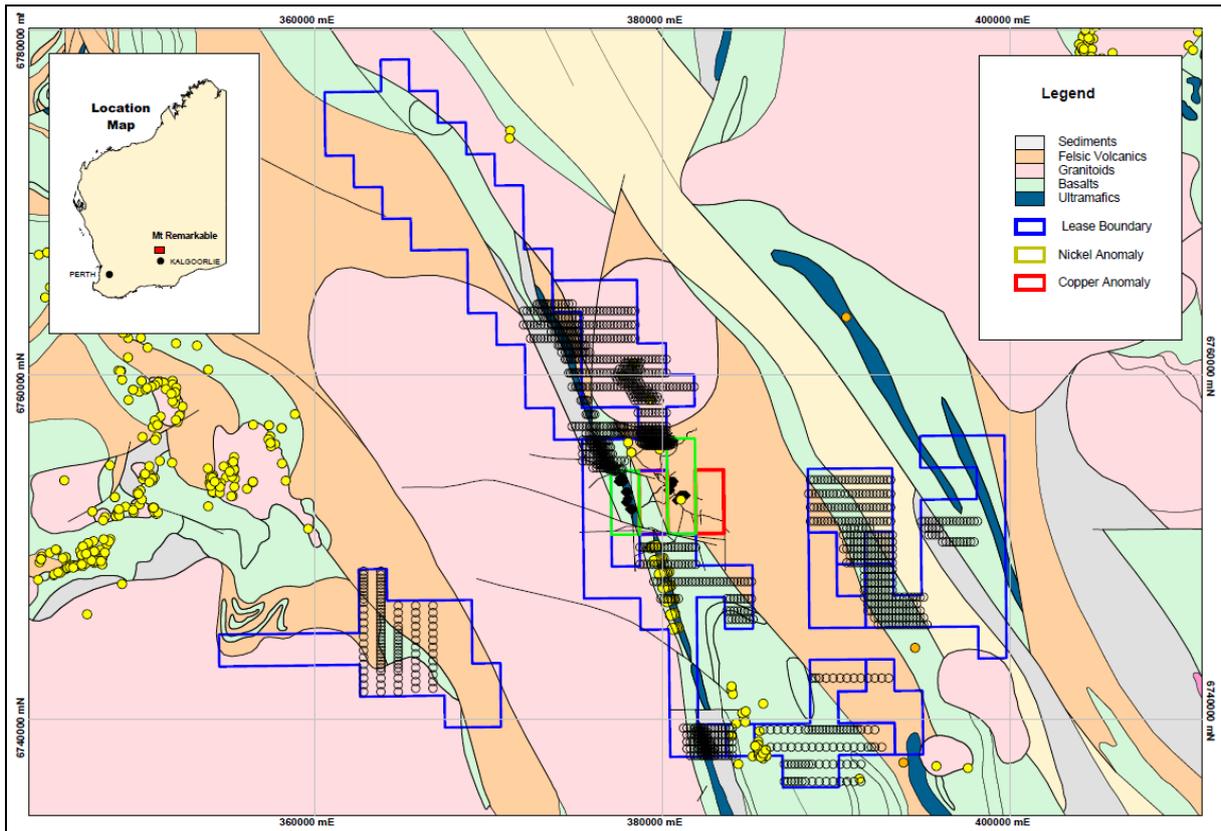

Figure 3: Mt Remarkable lease package showing planned geochemical sampling program.

In addition, the project includes several areas adjacent to and along strike from existing nickel deposits at Aublis, Yerilla and Boyce Creek (figure 4). These deposits form Heron Resources Yerilla Nickel Project which contains 135 Mt @ 0.77% Nickel and 0.05% Cobalt. The Yerilla Nickel project is currently being developed in conjunction with Chinese partners.

Key targets include outcropping ultramafic units immediately north of the Yerilla nickel deposit and 20 kilometres south of the Aublis nickel deposit. The Company is also testing the Mt Remarkable ultramafic unit north of the existing anomaly adjacent to the IXL and Excelsior gold prospects.

The Company considers the tenement package to have the potential to host a significant nickel and/or gold deposit.

White Cliff Nickel Ltd

About White Cliff Nickel Limited

White Cliff Nickel Limited is a Western Australian based nickel and gold explorer which listed on ASX on 14 December 2007 having raised \$6 million. The Company's key goal is to identify a mineable nickel or gold deposit via a systematic exploration process consisting of assessing and acquiring prospects, compiling historical results, sampling to identify gold and nickel soil anomalies followed by drilling.

Laverton Gold Project: The project consists of 1200 square kilometres of tenement applications in the Laverton and Merolia Greenstone belts. The core prospects are located 20km south of Laverton in the core of the structurally complex Laverton Tectonic zone immediately south of the Granny Smith Gold Mine (3 MOz) and 7 kilometres east of the Wallaby Gold Mine (7MOz). In addition, applications are pending over a large part of the Merolia Greenstone belt immediately Southwest of Laverton.

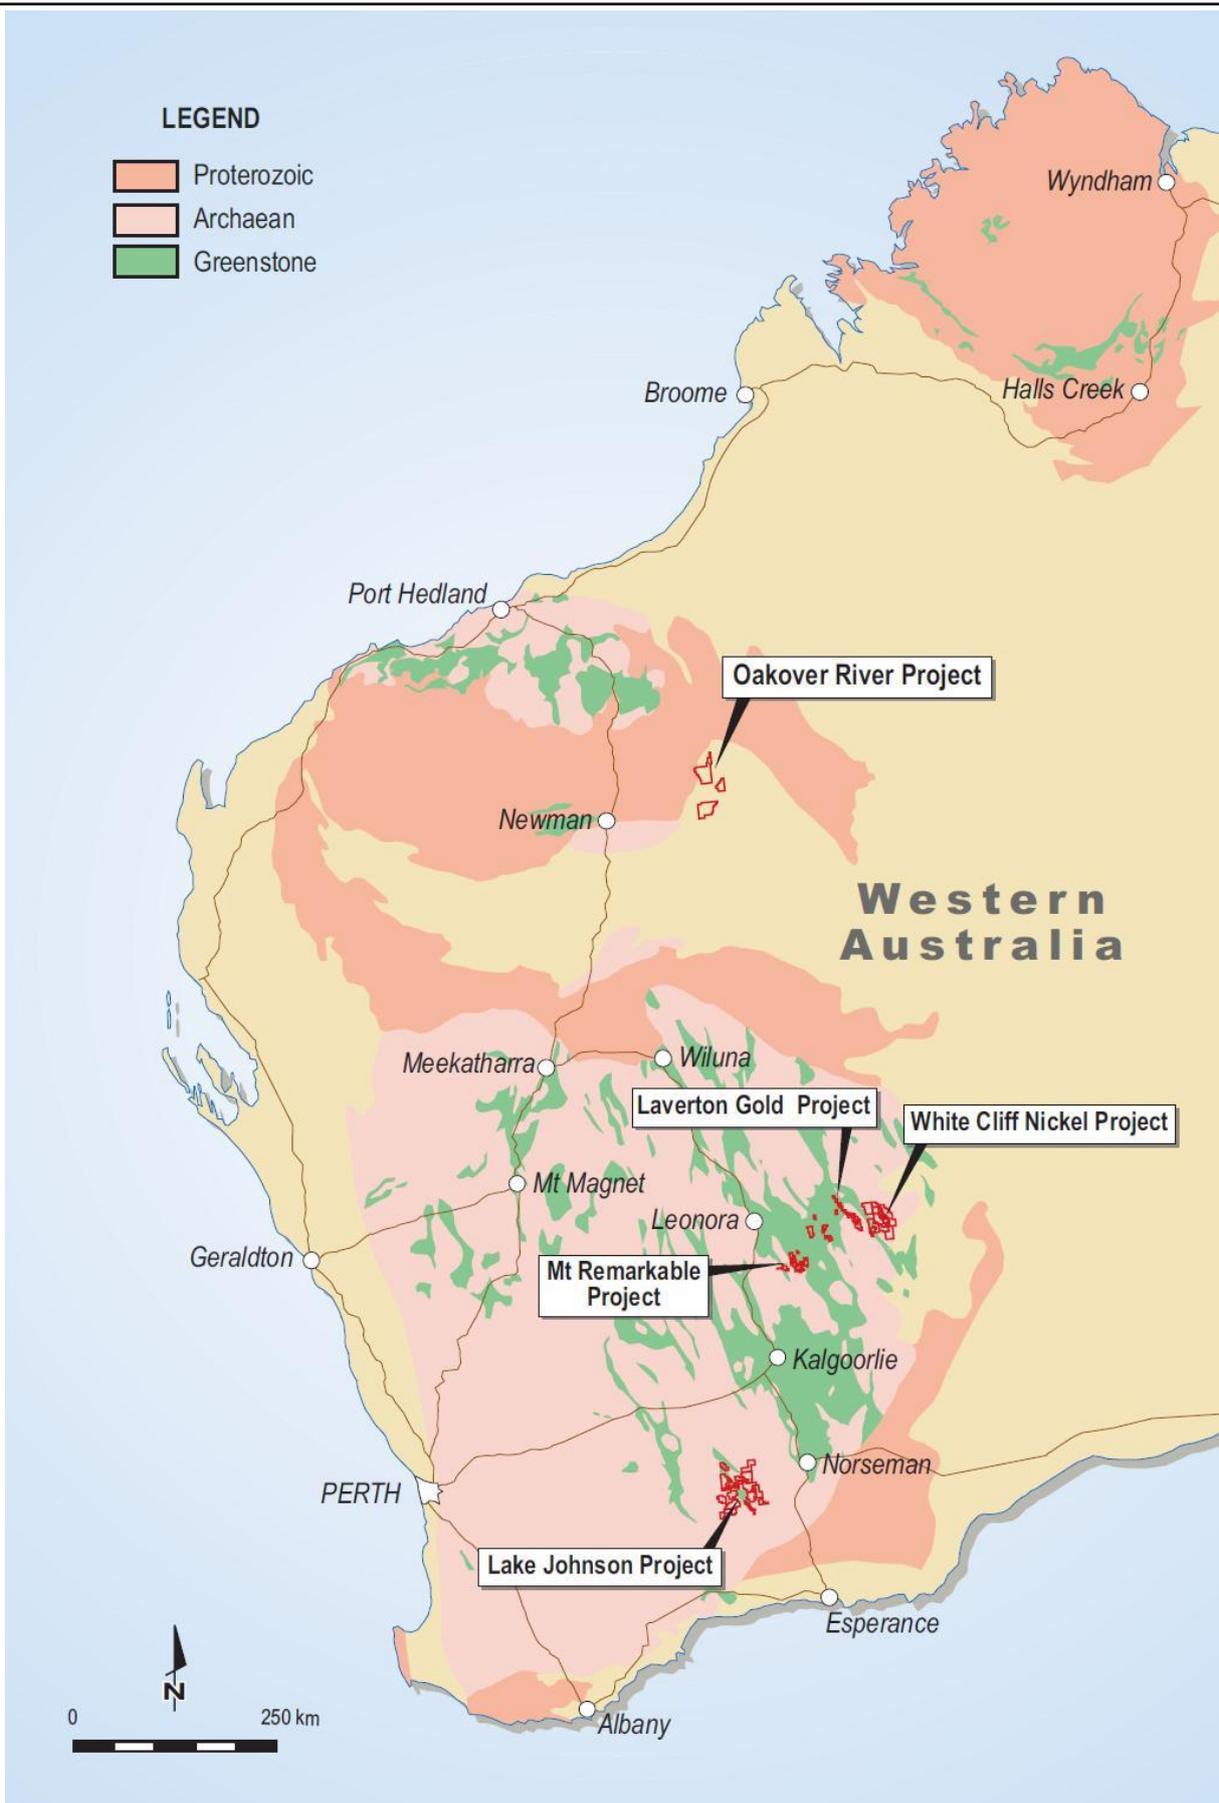

White Cliff Nickel Project: The project which covers over 1,200 square kilometres in the Merolia section of the Laverton Greenstone Belt situated 60 kilometres south-east of Laverton WA. The region contains the Irwin-Coglia and Mineral Patch Hill nickel deposits and Fish and Lord Byron Gold deposits. The project has been joint ventured with a Korean consortium, comprising Daewoo Intl and the 100% government owned Korea Resources Corporation. The Korean consortium can earn up to 50% of the project by the expenditure of up to \$5 million over the next 3 years.

Lake Johnston Project: The project covers over 1400 square kilometres in the Lake Johnson Greenstone Belt, which contains the Emily Ann and Maggie Hayes nickel sulphide deposits. These mines have a total resource of approximately 140,000 tonnes of contained nickel. The project area was previously held by Norilsk and has excellent prospectivity for both komatiite associated nickel sulphides and amphibolite facies high-grade gold mineralisation.

Mount Remarkable Project: The project covers 300 square kilometres and is located approximately 170 km N-NE of Kalgoorlie and about 25 km SE of Kookynie in the Northern Goldfields. Included in the project area are the historic gold mining centres of Mt Remarkable and Yerilla which consists of several old workings. Major gold mines in the surrounding area include Sons of Gwalia, Tarmoola, Carosue Dam, Granny Smith, Wallaby and Sunrise Dam. The project includes several areas adjacent to and along strike from existing nickel deposits at Aublis, Yerilla and Boyce Creek. These deposits form Heron Resources Yerilla Nickel Project which contains 135 Mt @ 0.77% Nickel and 0.05% Cobalt.

Oakover River Iron-Manganese Project: The project covers 970 square kilometres and is located approximately 140 km east of the town of Newman, Western Australia. The Northern lease contains the same sedimentary sequences area that host Hancock Mining's Balfour Manganese Mine 30 kilometres West and is considered to have potential iron and manganese mineralisation. Previous exploration data of the area is currently being evaluated and a field visit is planned later this year to further assess the project potential and to formulate an exploration program.

<p>The Information in this report that relates to exploration results, mineral resources or ore reserves is based on information compiled by Mr Todd Hibberd, who is a member of the Australian Institute of Mining and Metallurgy. Mr Hibberd is a full time employee of the company. Mr Hibberd has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2004 edition of the `Australian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves (the JORC Code)`. Mr Hibberd consents to the inclusion of this information in the form and context in which it appears in this report.</p>
