ASX Code: WCN

Drilling Commences on Multiple Lake Johnston Nickel Sulphide Targets

Highlights

- **3 hole drilling program underway at Mt Gordon on three nickel sulphide targets**
- **5 hole drill program to commence at Lake Percy immediately following Mt Gordon drilling**
- **Coincident EM and nickel-copper soil anomalies to be tested all occur along basal contact of ultramafic and underlying felsic sediments**

White Cliff Minerals Limited (“**White Cliff**” or “the **Company**”) (ASX:**WCN**) advises that drilling has commenced at the Mt Gordon prospect, targeting three coincident EM and nickel-copper soil anomalies interpreted to occur on the basal contact of the ultramafic unit and the underlying felsic sediments at depths of 150 to 250 metres (Figure1). The three holes will take approximately one week to complete with assay results expected to be available in approximately three weeks.

A five hole drilling program at the Lake Percy prospect also targeting coincident EM and nickel-copper soil anomalies will commence immediately following the Mt Gordon drilling (Figure 2). The five holes will take approximately two weeks to complete with assay results expected to be available three weeks later.

Managing Director Todd Hibberd commented, “We currently have eight first order category one drill targets at Mt Gordon and Lake Percy that will be tested in this drilling phase. The strong geochemical results recently reported from Mt Glasse provide us with confidence that a number of additional category one drill targets will be refined for the Company’s Phase Three drilling program, to be undertaken in mid-2013. We believe these are all excellent targets that provide the greatest opportunity to discover a new nickel sulphide deposit. White Cliff is fully funded for both Phase Two and Phase Three drilling at Lake Johnston.”

Figure 1 Regional geology map showing tenement holdings, mine locations and the location of the Mt Gordon and Lake Percy prospects. Inset yellow outline is Mt Gordon Drilling area.

Figure 2 Mount Gordon geological interpretation showing drill hole positions and conductors along the contact between the ultramafic and sedimentary units. The geology dips to the west and the conductive plates shown are between 100 and 300 metres below surface

Figure 3 Lake Percy geological interpretation showing drill hole positions and conductors along the contact between the ultramafic and sedimentary units. The geology is dips steeply to the west and the conductive plates shown are between 100 and 300 metres below surface

About White Cliff Minerals Limited

White Cliff Minerals Limited is a Western Australian based exploration company with the following projects:

Lake Johnston Project: This project covers approximately 1,400 square kilometres in the Lake Johnson Greenstone Belt. This Greenstone Belt contains Norilsk's Emily Ann and Maggie Hayes nickel sulphide mines which combined have a total resource of approximately 140,000 tonnes of contained nickel. Much of the project area was previously held by LionOre and is highly prospective for both komatiite associated nickel sulphides and amphibolite facies high-grade gold mineralisation. The area contains little outcrop, with the bedrock geology concealed by transported cover. Recent geophysical surveys have identified multiple new nickel sulphide targets that require drill testing.

Chanach Copper-Gold Project: The project consists of 83 square kilometres and is located in the Kyrgyz Republic 350km west-southwest of the capital city of Bishkek. The Chanach project is located in the western part of the Tien Shan Belt, a highly mineralised zone that extending for over 2500 km, from western Uzbekistan, through Tajikistan, Kyrgyz Republic and southern Kazakhstan to western China. Mineralisation occurs as porphyry and epithermal systems developed within magmatic arcs, and orogenic type gold deposits that are structurally controlled. Major deposits located within 100km of Chanach contain up to 93 million ounces of gold and 25 million tonnes of copper. Initial work indicates that the project hosts porphyry and skarn style copper and gold mineralisation. Drilling has identified several areas containing up to 2.1% copper and 1-2 g/t gold while rock sampling has identified up to 5% copper and 40 g/t gold within a large mineralised area.

White Cliff Nickel Project: The project which covers over 1,200 square kilometres in the Merolia section of the Laverton Greenstone Belt situated 60 kilometres south-east of Laverton WA. The region contains the Irwin-Coglia and Mineral Patch Hill nickel deposits and Fish and Lord Byron Gold deposits.

Mount Remarkable Project: The project located approximately 170 km N-NE of Kalgoorlie and about 25 km SE of Kookynie in the Northern Goldfields. Included in the project area are the historic mining centres of Mt Remarkable and Yerilla which consists of several old workings. Major gold mines in the surrounding area include Sons of Gwalia, Tarmoola, Carosue Dam, Granny Smith, Wallaby and Sunrise Dam.

Laverton Gold Project: The project consists of 1200 square kilometres in the Laverton and Merolia Greenstone belts. The core prospects are located 20km south of Laverton in the core of the structurally complex Laverton Tectonic zone immediately south of the Granny Smith Gold Mine (3 MOz) and 7 kilometres east of the Wallaby Gold Mine (7MOz). In addition, applications are pending over a large part of the Merolia Greenstone belt immediately Southwest of Laverton.

Ghan Well Project: The project covers an area of 83km² located approximately 40km South-West of Laverton. The project is centred on a 6km long nickeliferous ultramafic unit. Minara Resources is currently mining from the Murrin Murrin East Pit along strike from the Company's recent drilling. The cumulate textures observed in the ultramafic unit suggest the unit is prospective for nickel sulphide mineralisation at depth.

The Information in this report that relates to exploration results, mineral resources or ore reserves is based on information compiled by Mr Todd Hibberd, who is a member of the Australian Institute of Mining and Metallurgy. Mr Hibberd is a full time employee of the company. Mr Hibberd has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2004 edition of the 'Australian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves (the JORC Code)'. Mr Hibberd consents to the inclusion of this information in the form and context in which it appears in this report.
